Actionee HAIS

Sub Category

Subject X500 directory service (GDS) namespace must be compatible with NASA standards for namespace allocation.

Description of Problem or Suggestion:

No level 4 requirement for the GDS namespace exists to ensure compatibility with existing NASA namespace structures, which will be essential for general agency directory service integration.

Originator's Recommendation

A new level 4 requirement should be added to require compatibility of all namespaces used in CSMS to be compatible with standard agency wide namespace allocations (for X.500, DNS, etc...) CSMS staff should participate in EMIG meetings where X.500 directory standards are set.

HAIS Response Date 2/28/95

A new requirement has been added in the directory service accordingly. The requirement states that "C-CSS-20130 The CSS Directory service shall provide namespaces that are compatible with the existing NASA X.500 and DNS directory services". CSMS staff will also participate in EMIG meetings where X.500 issues are discussed.
